

VENOSCOPE® II

TRANSILLUMINATOR
THE VEIN FINDER™

Only available from Graykon Scientific

The **Venoscope® II** transilluminator, **The Vein Finder™**, allows a clinician to easily locate hard to find veins, making it faster and more efficient for health care providers and clinicians to deliver a higher level of quality care. Fewer sticks means less time that a clinician needs to spend with each patient, reduces the waste of materials such as needles, syringes, PICC and midline trays, and makes the procedure safer and more comfortable for the patient.

Although in most cases a clinician can easily identify and access the veins of their patient's, there are those patients with hard to find veins, such as the obese, elderly and patients with dark skin. Data collected in hospital settings show that as a result of patients with hard to find veins, **multiple sticks occur on twenty-five (25%) percent of patients.** By using the **Venoscope® II**, a clinician can reduce multiple sticks and increase the first stick success rate toward the 100% mark.

Usage Applications Include:

IV Therapy, Neonatal / Infant Care, Home Care, Emergency Care, Sclerotherapy, Ambulatory Phlebectomy, Haemophilia.

The use of the **Venoscope® II** is a non-invasive procedure, and is done by placing the **Venoscope® II** on the surface of the skin of a patient in such a way that the high intensity light of **Venoscope® II** is projected into the subcutaneous tissue of a patient. The light causes the veins of a patient to contrast with the surrounding tissue, thereby making it easier to locate veins suitable for IV therapy and blood draws.

Features:

- **High Intensity, Dual Wavelength, LED Light Source**
- **Three Position Rocker Switch (High - Off - Low)**
- **Low Battery Indication Light**
- **Uses 3 AA Alkaline Batteries**

Venoscope® II Transilluminator
Model Number VT03

Neonatal Transilluminator

Specially Designed for Special Patients

Finally, a neonatal transilluminator designed specifically with you and the neonate in mind. We've taken all the great features of the **Venoscope® II** and put them into a transilluminator that better serves the special needs of your neonatal patients. It still features the same powerful LED lights, but is now smaller and more portable, making it even easier to use with neonates. The cool lights are strong enough to illuminate the hardest to find veins without the risk of burning the baby. Creating happier babies makes happier nurses.

The **Neonatal Transilluminator** weighs just 6 ounces including the 3 "AA" batteries. It features a low battery indicator light that alerts the nurse to change the batteries.

Features:

- **Easy to use**
- **Bright / Cool lights that won't burn the baby**
- **Compact / Portable**
- **Battery Operated**

Venoscope Disposables

Disposable Protective Covers

The Disposable Protective Covers are made of clear plastic, no latex, and are designed to cover the Venoscope® II so that blood or body fluids do not contaminate the light. The covers are packaged in a convenient tear away pack of 50 covers per pack. Simply tear one of the covers off the pack and slip the Venoscope® II into it. The cover is designed to fold over to cover the entire light. Pull the cover over the arms so that there is a clear field of vision between the arms when in use.

Velstretch Straps

The Velstretch Straps allow the nurse to free up both hands for the venipuncture and to help stabilise the vein to prevent vein rolling.
